WORK EXPERIENCE

Accelya Solutions Ind. Ltd. | Software Engineer (**Backend/Full Stack)** | Hybrid March 2023 - Present

- Built and **maintained backend services** supporting audit and financial workflows for **100+ global airlines**, ensuring reliability and data accuracy in high-volume environments.
- Designed and **implemented RESTful APIs** using **Node.js and Express.js**, including authentication (**JWT-based RBAC**) and secure access to sensitive operational and financial data.
- **Improved database performance** by analysing slow queries and applying indexing, query refactoring, and schema optimizations across **MS SQL Server and MongoDB**.
- Identified high-latency read paths from production logs and introduced **Redis-based caching with TTL** and invalidation strategies, reducing API response times by ~30% during peak usage.
- Acted as a first responder for production issues, investigating failures using logs and database metrics, and delivering permanent backend fixes instead of temporary workarounds.
- **Worked on data migrations** and schema changes, ensuring ACID compliance and backward compatibility for large, business-critical datasets.
- Built internal admin and configuration dashboards using **React.js and Tailwind CSS** to manage audit rules, airline configurations, and user access.
- **Integrated frontend components** with backend APIs, implementing proper loading, error, and authorization states to ensure predictable and stable user experiences.
- Collaborated with Product and QA teams to translate business requirements into end-to-end features deployed to production.
- Containerized services using **Docker** and participated in **CI/CD pipelines** to automate testing and deployments.
- **Worked in an Agile environment**, actively participating in sprint planning, code reviews, and retrospectives to improve code quality and delivery timelines.

Acmegrade | Full Stack Developer Intern | Hybrid Jan 2022 – March 2022

- Developed and configured a fully-functional e-commerce website using **HTML, Tailwind CSS, React JS, SQL**, and **JavaScript**.
- Utilized **MongoDB and SQL** to manage and manipulate data efficiently and Integrated JavaScript to enhance user interaction and interface with site

TECHNICAL SKILLS

Languages: JavaScript (ES6+), MS SQL Server, Python, Java, HTML/CSS

Framework and Technologies: Node.js, Express.js, REST APIs, GraphQL (basic), MongoDB, Mongoose, SQL Server, React.js, Redux, RTK Query, Tailwind CSS, Git, GitHub, GitLab, CI/CD (GitLab), Docker, Kubernetes (basic), Postman, JIRA, AWS (basic)

EDUCATION

Pillai HOC College of Engineering and Technology Panvel, India

Bachelor of Engineering in Computer Science – 8.87 CGPA June 2019 - May 2023

PROJECTS

Chaos Monkey Lite | Node.JS, Express.Js, ReactJS, TailwindCSS, REST API, Express Middleware

- Built a lightweight chaos-engineering tool to inject controlled failures (latency, partial failures, CPU spike, Memory Leakages etc) at the middleware level without modifying business logic.
- Designed backend middleware to simulate real-world production failure scenarios and observe system behavior under stress.
- Developed a React + Tailwind admin UI to enable/disable chaos modes and visualize injected faults, focusing on clarity and control rather than visual polish. Built practical understanding of failure propagation and resilience in distributed systems.

Decentragram | ReactJS, Blockchain, Solidity, Web3.Js

- Decentragram is an Instagram-inspired **decentralized** platform, created using **Solidity, Web3.js, React JS, and IPFS**.
- Smart contracts, developed in Solidity, facilitate the successful creation, tipping, and content updates. An injected wallet, such as **MetaMask**, is integrated into the front-end source through Web3.js.
- This entire project operates on the **Ethereum Blockchain**. Content is sorted based on the amount of Ether it has been tipped. User accounts are updated after content publication and content is sorted by tipped Ether
